Esquema de la base de dades

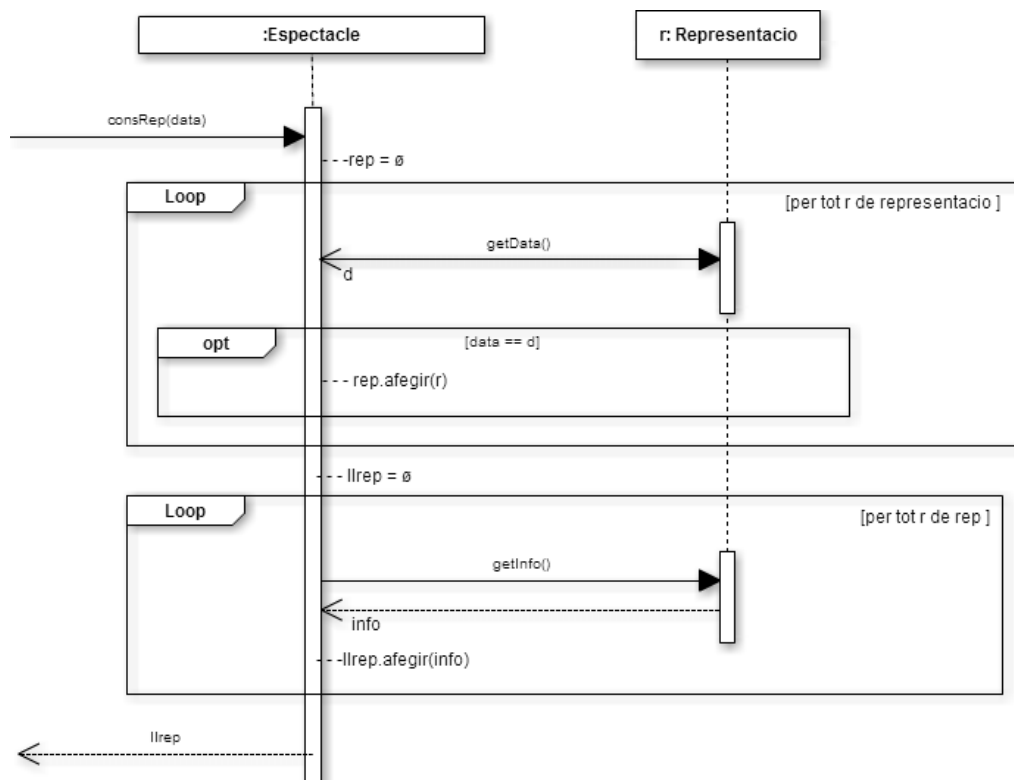

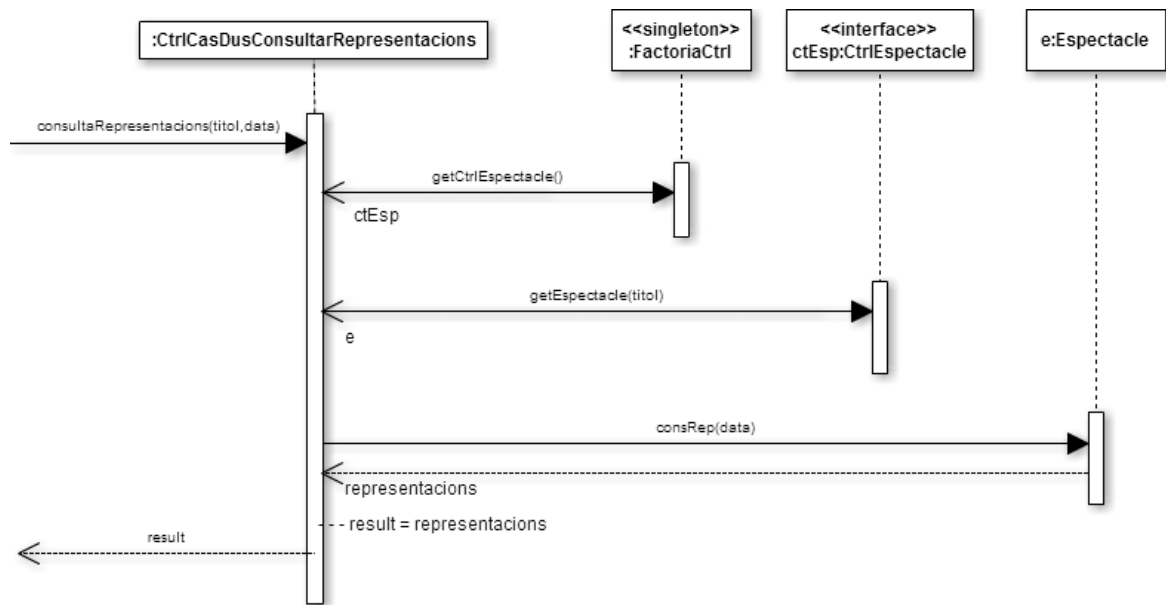

2.

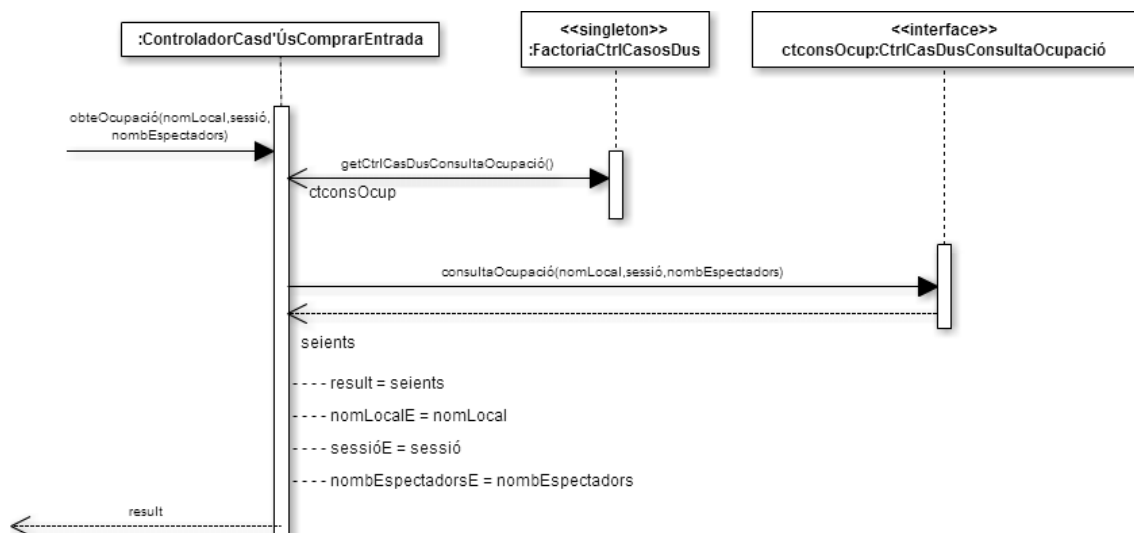

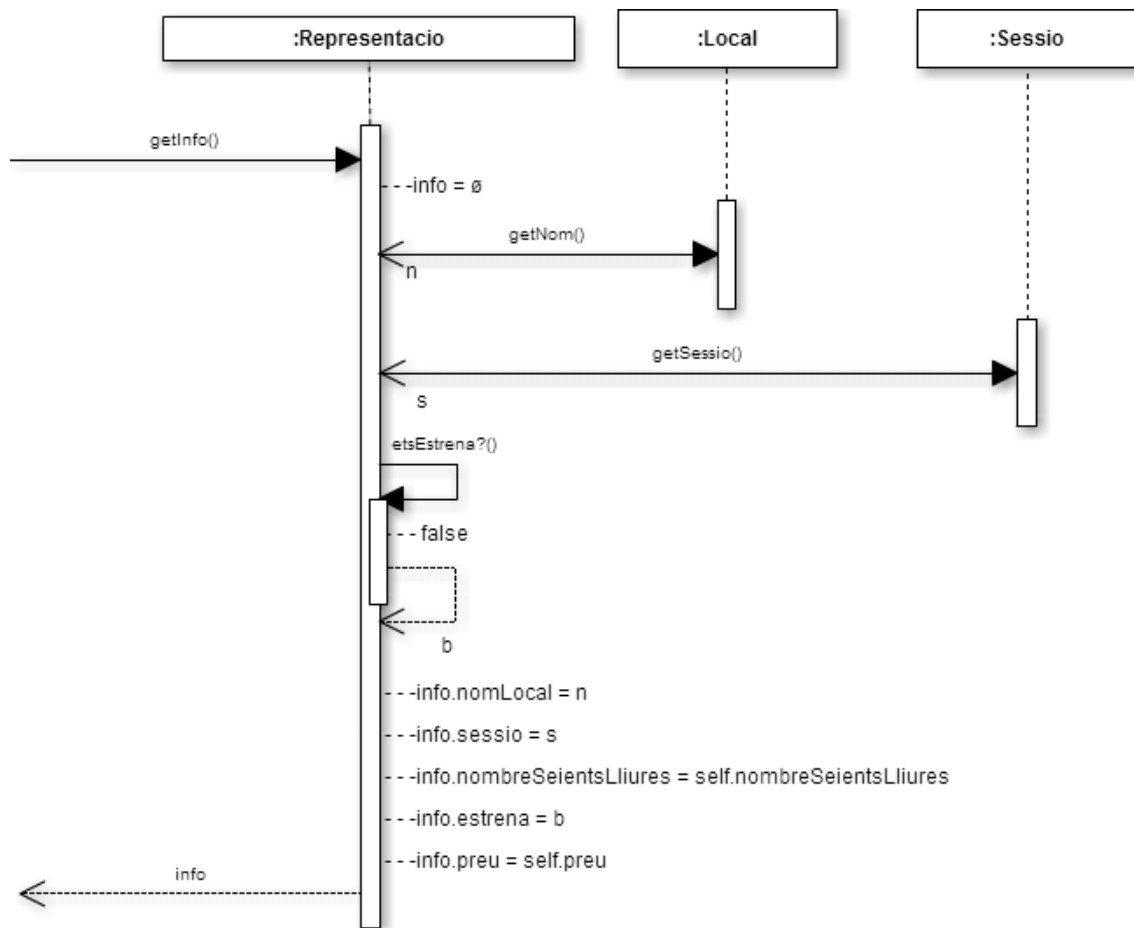

**Error1!!! no se deben regresar objetos, sino lista de títulos. Así que hace falta recorrer el conjunto de objetos Espectacle e invocar getTitol.**

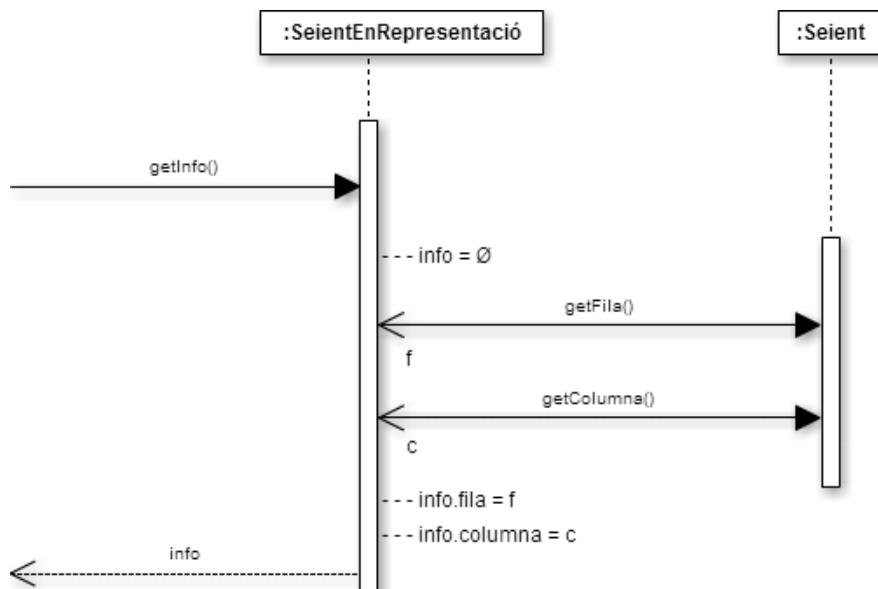

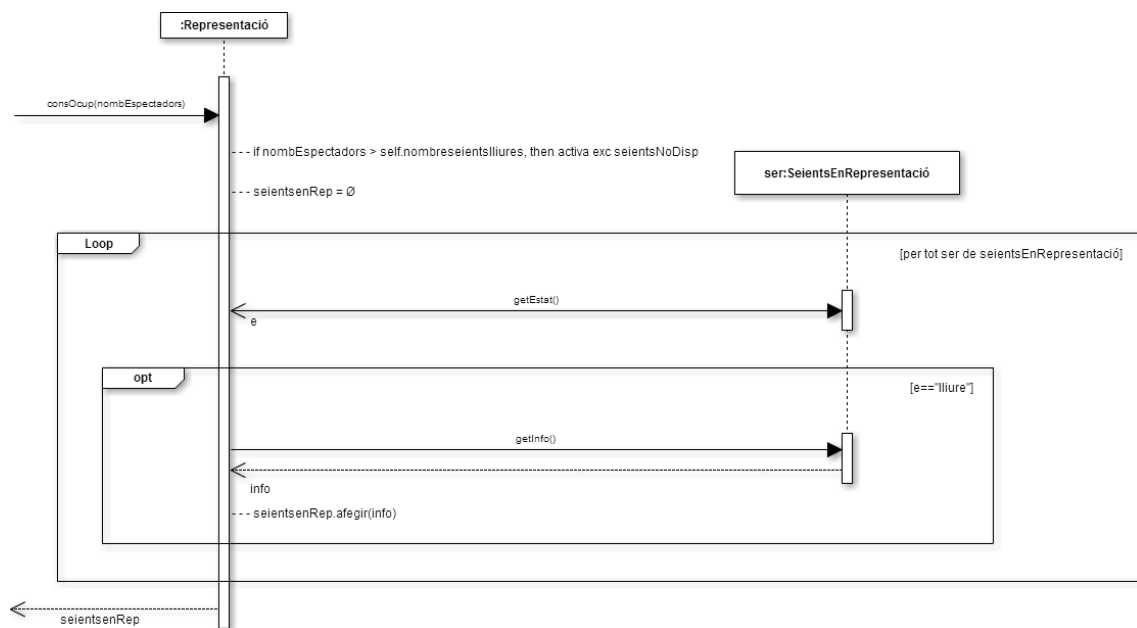

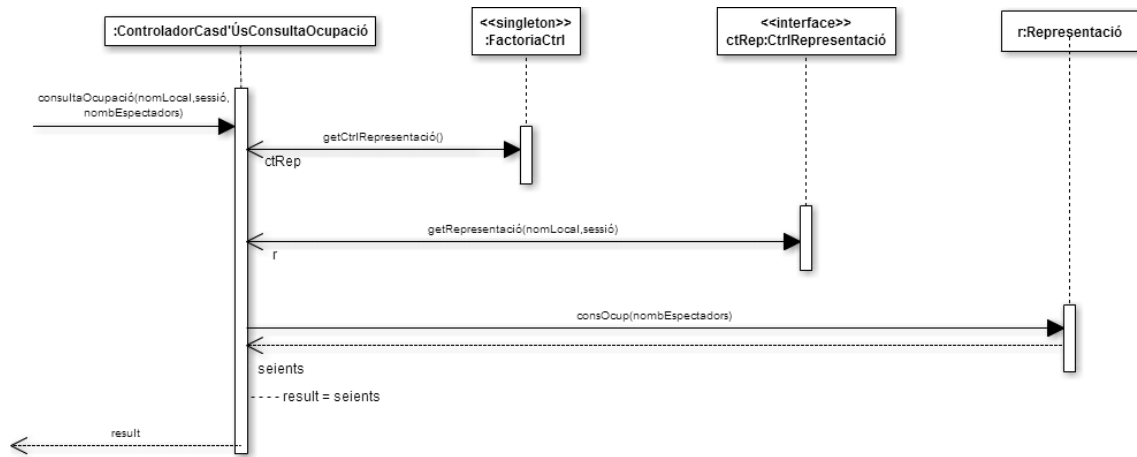

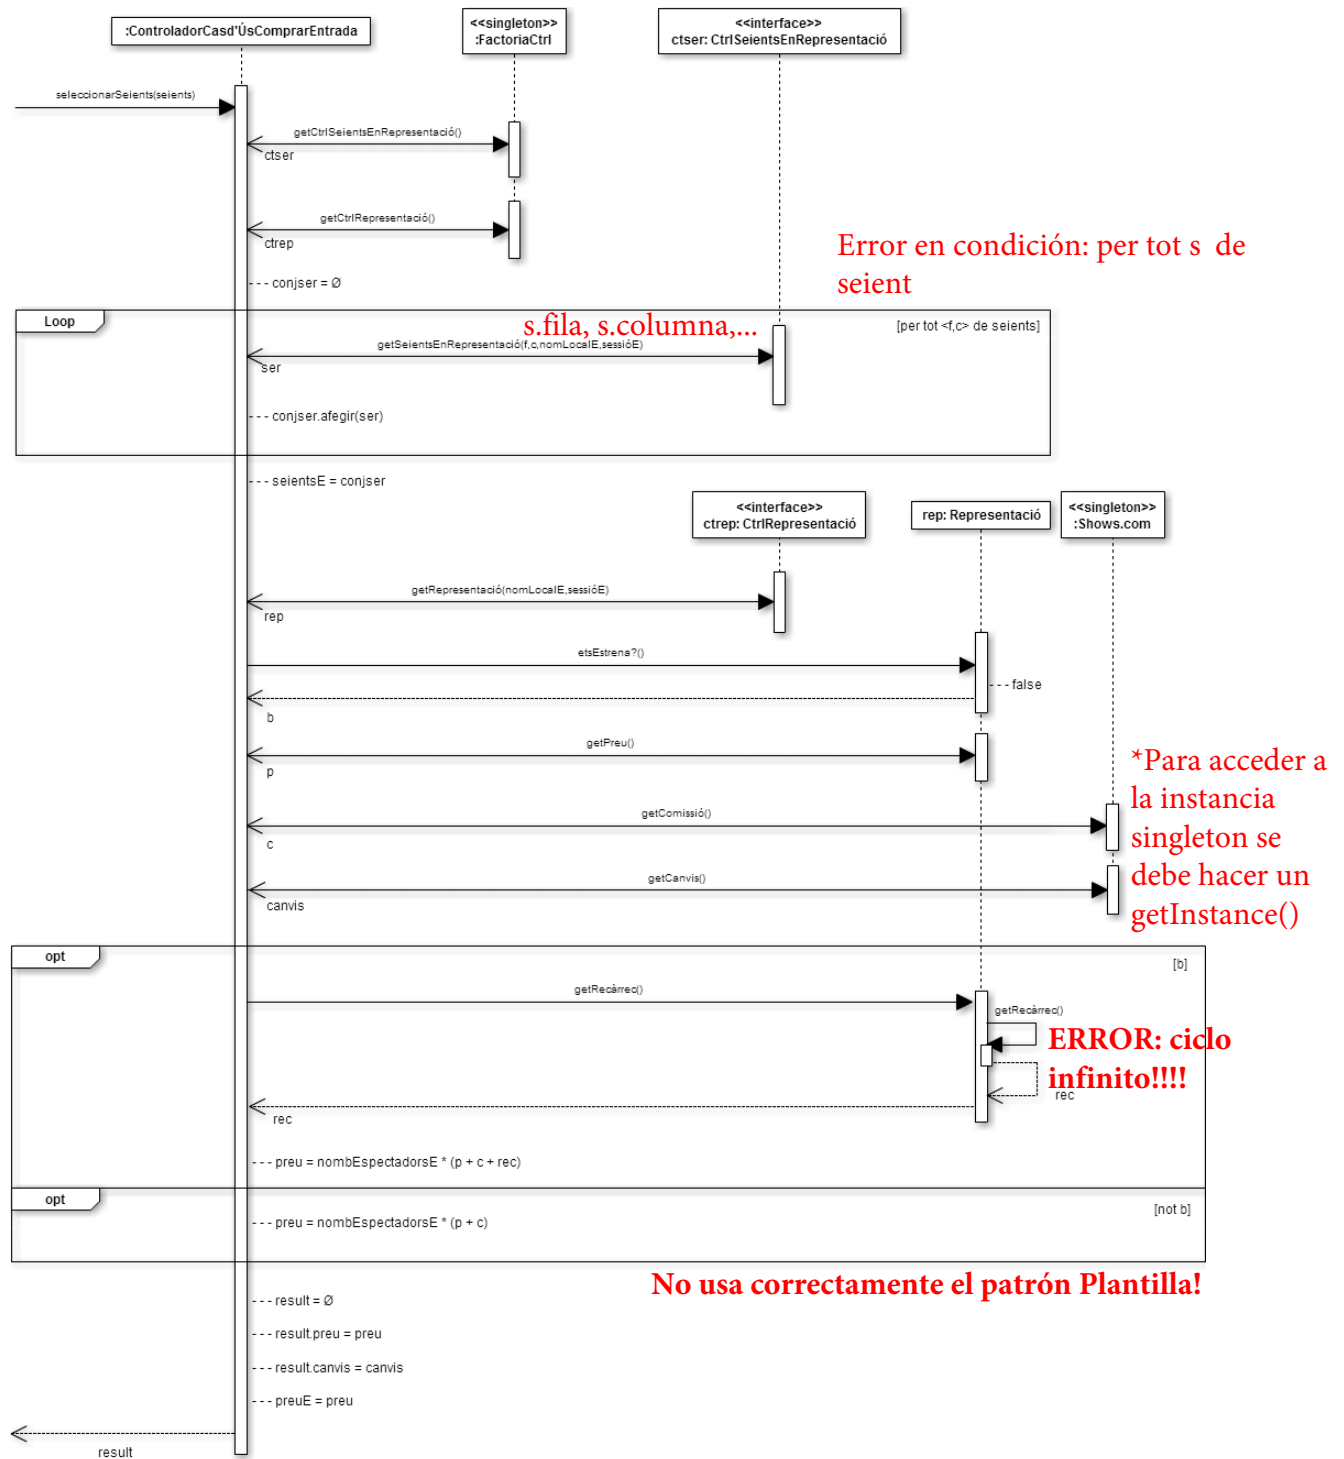

**Porqué dos Loops diferentes? Es ineficiente, podría usarse el mismo**

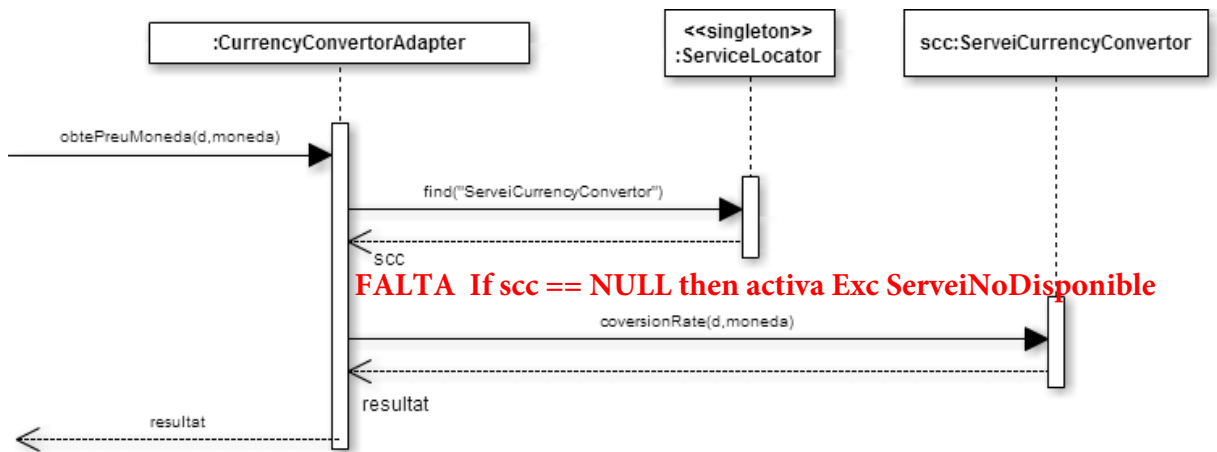

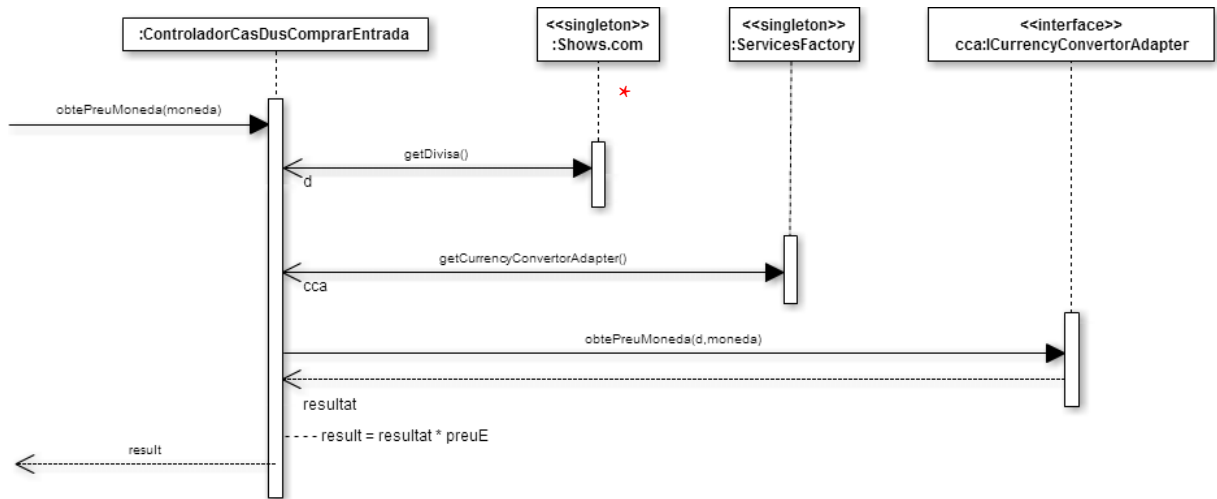

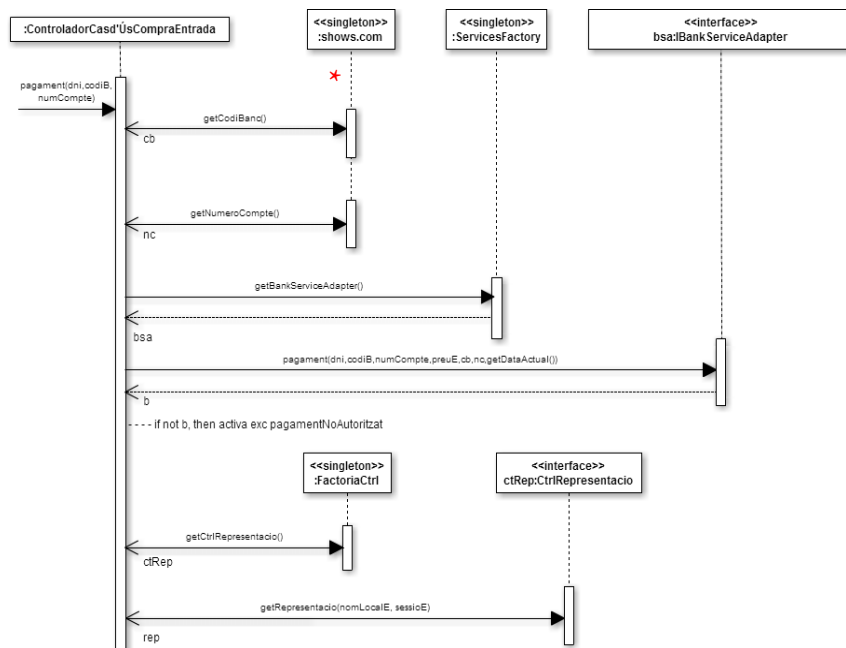

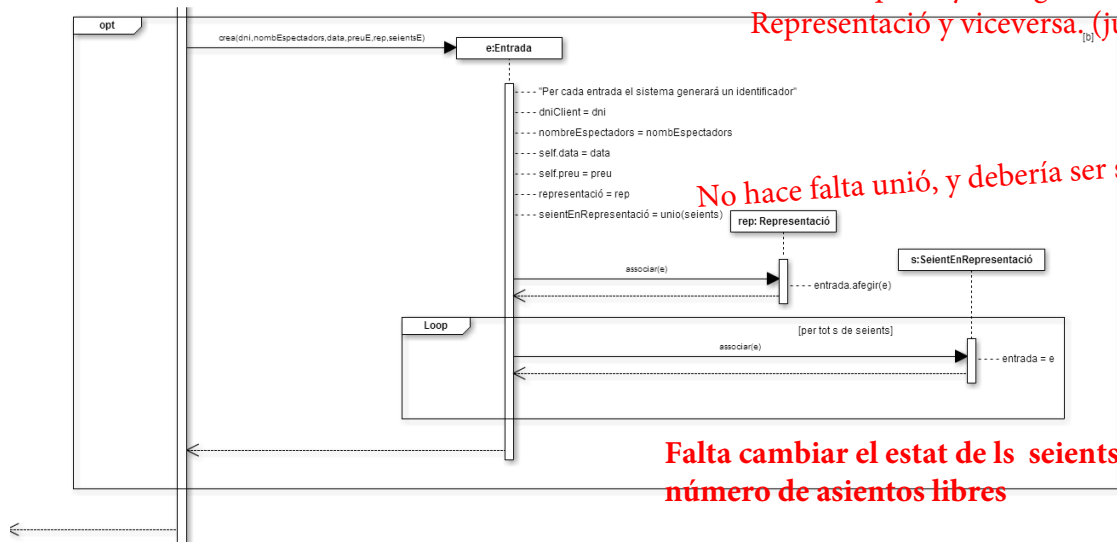

## Nombre confuso:mejor AdaptersFactory

**FALTA** If scc == NULL then activa Exc ServeiNoDisponible

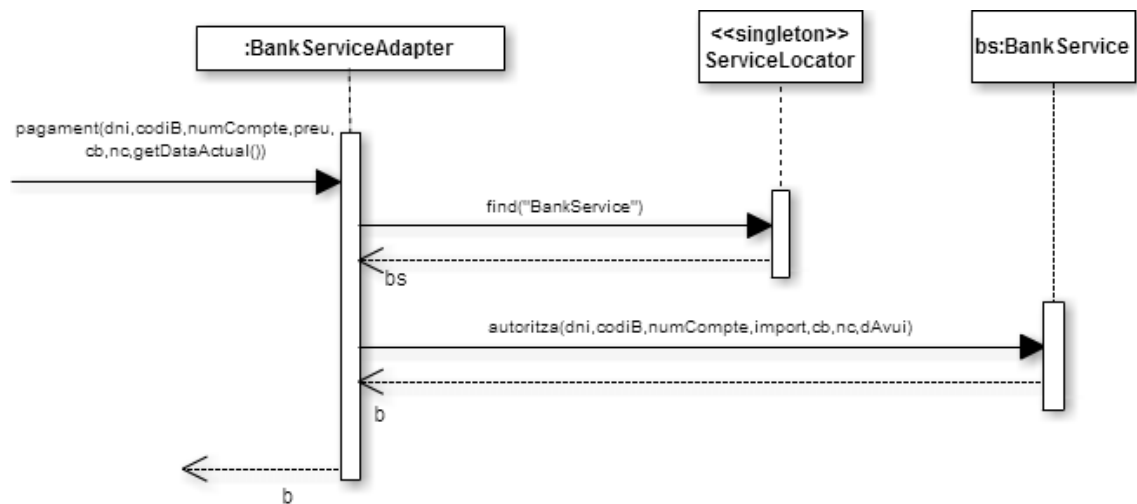

-Asumís que hay navegabilidad de Entrada a Representació y viceversa. (justificar)

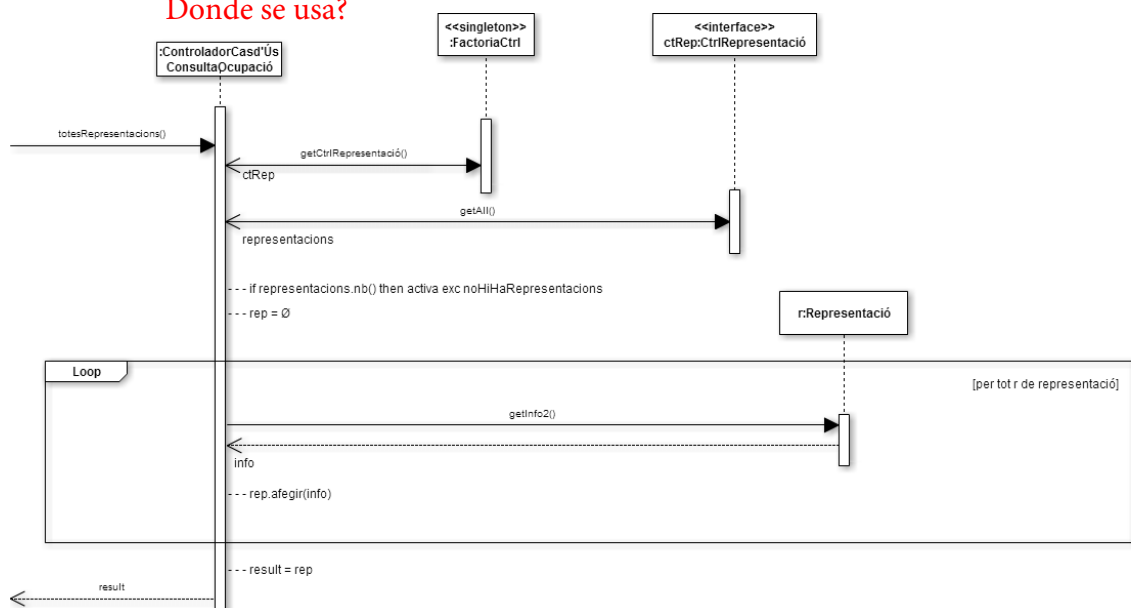

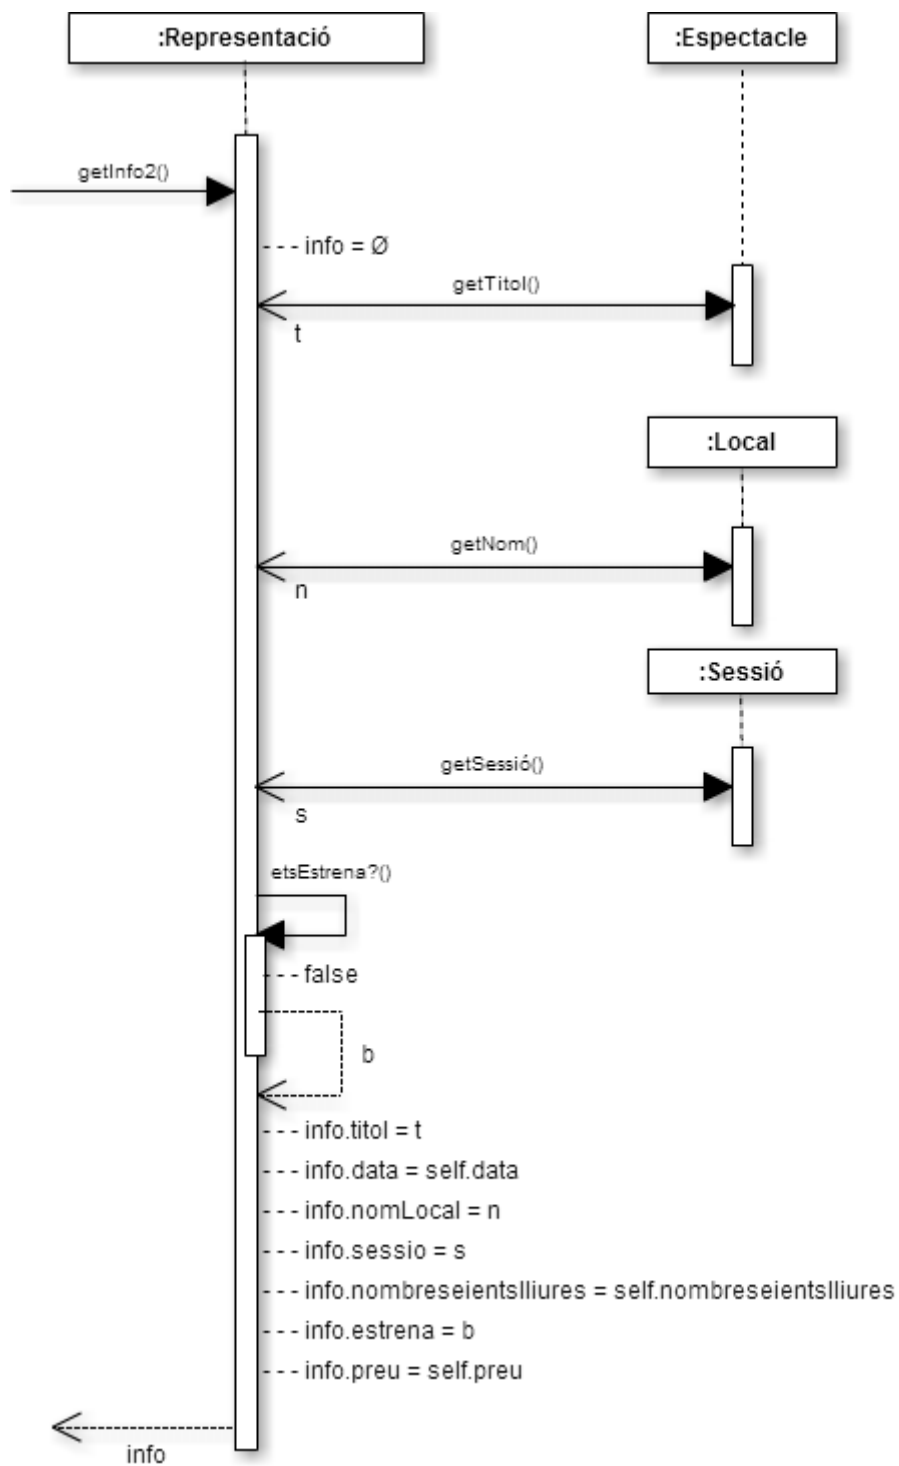

No hace falta unió, y debería ser seientE

Falta cambiar el estat de ls seients! y actualizar número de asientos libres

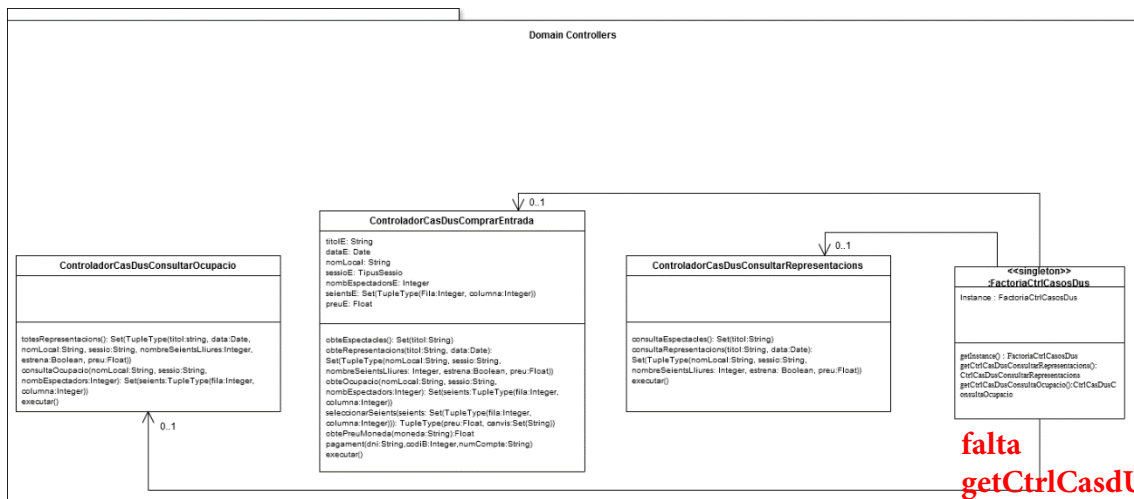

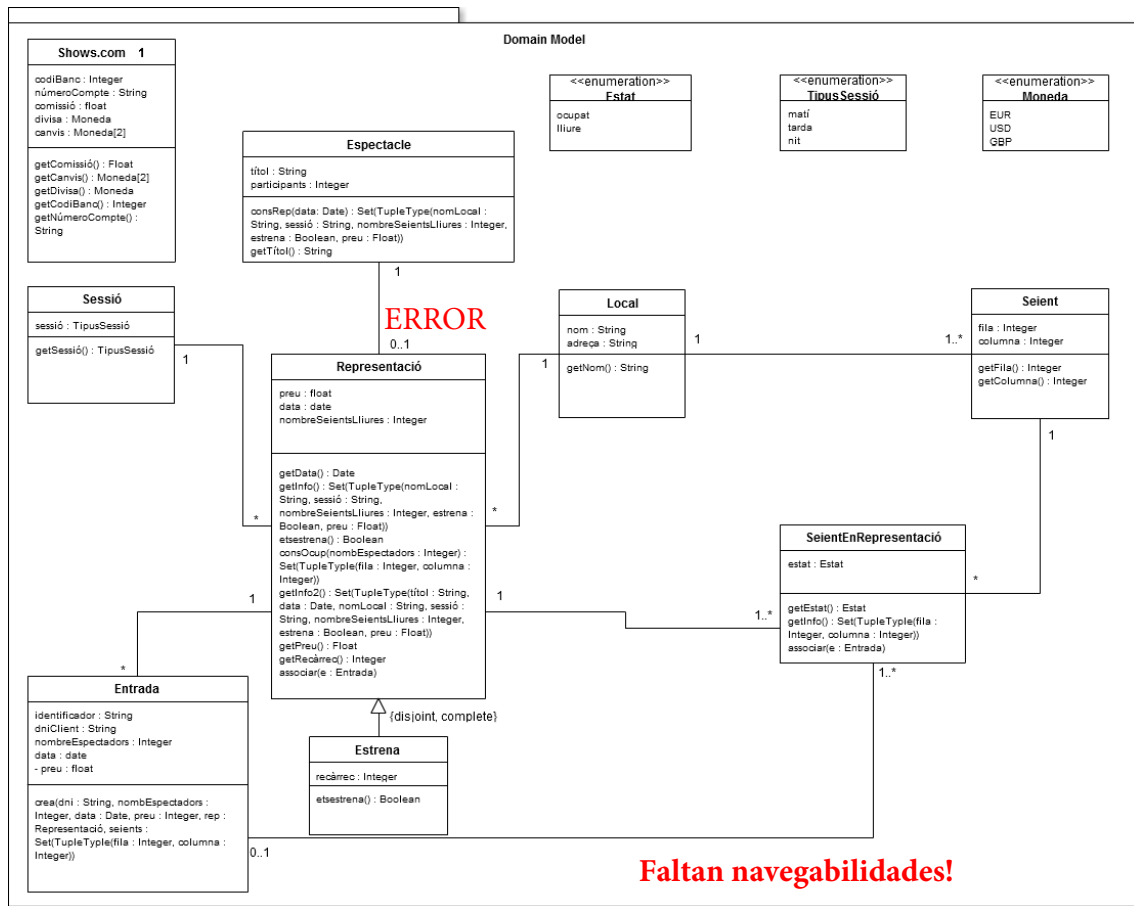

Donde se usa?

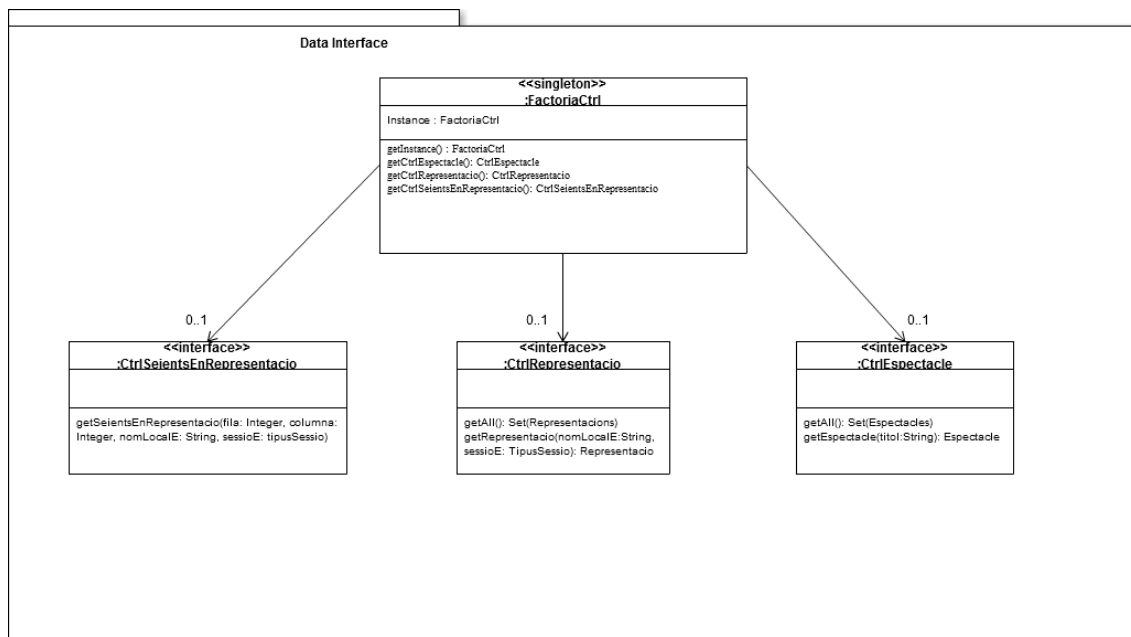

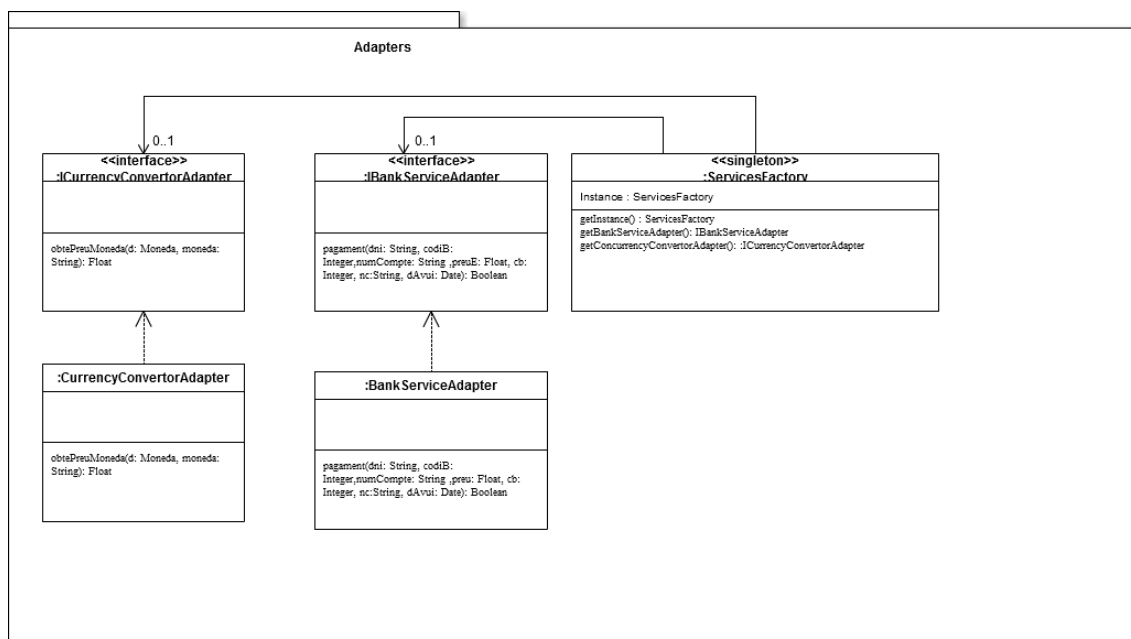

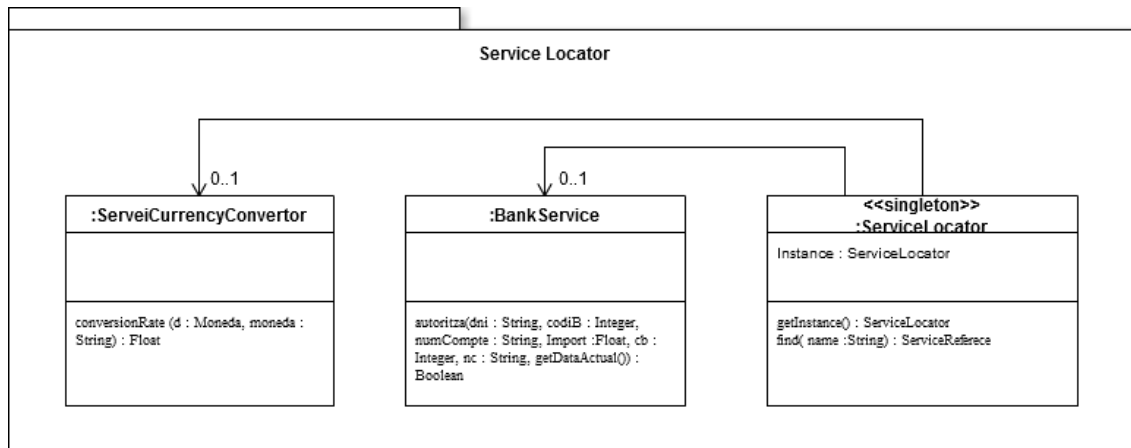

3.

**Error: No debe haber Executar()**

4.

Per emmagatzemar la informació que hem anat generant en els diagrames de seqüència que necessitarem per altres operacions, hem utilitzat el patró Controlador Cas D'ús.

Hem fet servir el patró Creador a l'hora de decidir a quina classe assignar la responsabilitat de crear una instància de la classe Entrada. En el nostre cas el creador serà el Controlador Cas D'ús Comprar Entrada.

El patró Factoria crea famílies d'objectes que estan relacionades i retorna la interfície que l'usuari sol·licita, per tant, hem decidit utilitzar aquest patró a l'hora d'obtenir tots els controladors i adaptadors.

El Service Locator ens permet adquirir els serveis remots que necessitem.

Quan tenim classes amb una única instància que han de ser accessibles des de diversos punts del sistema utilitzem el Singleton. Per això l'utilitzem en les factories, service locator i shows.com per que hem de poder accedir des de qualsevol cas d'ús.

Per últim, hem utilitzat el patró Adapter per convertir la funcionalitat d'obté preu moneda i de pagament en la funcionalitat que realment necessitem.
